

## Building of fiber optic networks in an urban environment FTTx

# SIDECUT SC3C

## Performance of microtrenches for the deployment of fiber optic networks in a urban environment

### Process

- Axially driven cutting wheel
- Cutting chain
- Microtrench for fiber optic network

### Specific features

- Limited size of the vehicle, which allows cutting in sidewalks
- Dry microtrenching with a vacuum system in option
- Sound proofing of the components
- No blasting and no dust during the burying works
- Quick network deployment process

### Assets

- The microtrench and the job site are clean
- Speed of execution,
- No disturbance to pedestrians during the works
- Limited disturbance to residents
- Increased safety of the jobsite
- No damage to road foundations
- Sidewalk can be used again very soon
- Reduction in building costs
- Trenching in curbs

### Innovation

- Fully remote controlled

### Output

- Between 40 and 120 ml/hour

## Features of the cutting tool

- Axially driven cutting wheel

Type of wheel	Cutting width (mm)	Trench depth (mm)
R250	25 to 60	250
R350	35 to 70	350
R450	45 to 80	450

## Cutting chain

Type of chain	Cutting width (mm)	Trench depth (mm)
C570	100	570
C840	120	840
	150	840

- Cutting tool mounted on 5-axis boom
- Slope correction of the tool  $\pm 15^\circ$
- Lateral offset of the tool outside the machine: 250 mm

## Sizes and weight

- Length in working position: 4.80 m to 5.30 m according to the tool
- Length in transport position: 4.50 m to 5.00 m according to the tool
- Width: 1.10 m
- Height: 1.80 m
- Unloaded weight: 4 to 4.50 tons according to the tool

## Technical diagram

## Carrier

- Carrier with caterpillar
- 100 ch (73,6 kW) diesel engine
- Hydrostatic advance

## Accessoires

- Remote control
- Wheel equipped of a suction system
